Firebase & Git Configuration Audit Report

Project: push_notification_demo | **Developer:** Soumya8792 | **Date:** November 2026

1. Firebase Integration Status

Firebase has been fully integrated into the Flutter project. Below is the platform verification audit:

Component	File Path	Status	Description
FlutterFire Options	`lib/firebase_options.dart`	CONFIGURED	Generated platform options for Android, iOS, macOS, and Web.
Android Config	`android/app/google-services.json`	CONFIGURED	Firebase configuration file for Android app build.
iOS Config	`ios/Runner/GoogleService-Info.plist`	CONFIGURED	Firebase configuration file for iOS app build.
Initialization	`lib/main.dart`	WIRED	`FcmPushKit.instance.initialize(...)` called on startup.

2. Git Exclusions & Ignored Files Audit

The following file types are explicitly excluded in `.gitignore` to maintain security and keep the repository clean:

Category	File / Pattern	Git Status	Reason for Exclusion
Debug Logs	`*.log` (e.g. `firebase-debug.log`)	IGNORED	Contains local authentication tokens and temporary CLI debug traces.
Build Artifacts	`/build/`, `.dart_tool/`	IGNORED	Machine-compiled outputs and pub dependency metadata.
IDE Settings	`.idea/`, `*.iml`, `.vscode/`	IGNORED	Personal editor preferences and local workspace files.
Pub Caches	`.pub/`, `.pub-cache/`	IGNORED	Local Flutter package cache directory.

3. Files Staged for Commit

All core source files and required platform configurations are staged and ready for Git commit:

> `android/app/google-services.json` (Firebase Android) `ios/Runner/GoogleService-Info.plist` (Firebase iOS) `lib/firebase_options.dart` (Generated FlutterFire options)

`packages/fcm_push_kit/` (Internal notification package) `lib/main.dart` & `lib/router/app_router.dart` (Application logic)

Git Push Instructions:

To push your changes to your GitHub repository (`Soumya8792/push_notification`), execute:

```
git commit -m "Add Firebase configuration and update notification service"
git push -u origin main
```
